Day 1: Overview of Hardware Components Theory (1 hour): Introduction to motherboards, CPUs, RAM, GPUS, storage (HDD, SSD).Importance of each component in a computer system. Assignment: Create a diagram of a PC with labeled hardware components.

1.Draw a labeled diagram of a desktop PC, clearly marking the motherboard, CPU, RAM, GPU, and both HDD and SSD storage components.

**2.Create a comparison table showing the main differences between HDD and SSD storage in terms of speed, durability, and typical use cases.

 Hint: Think about which one is faster, which is more shock-resistant, and where you would usually find each type (laptop, gaming PC, etc.).**

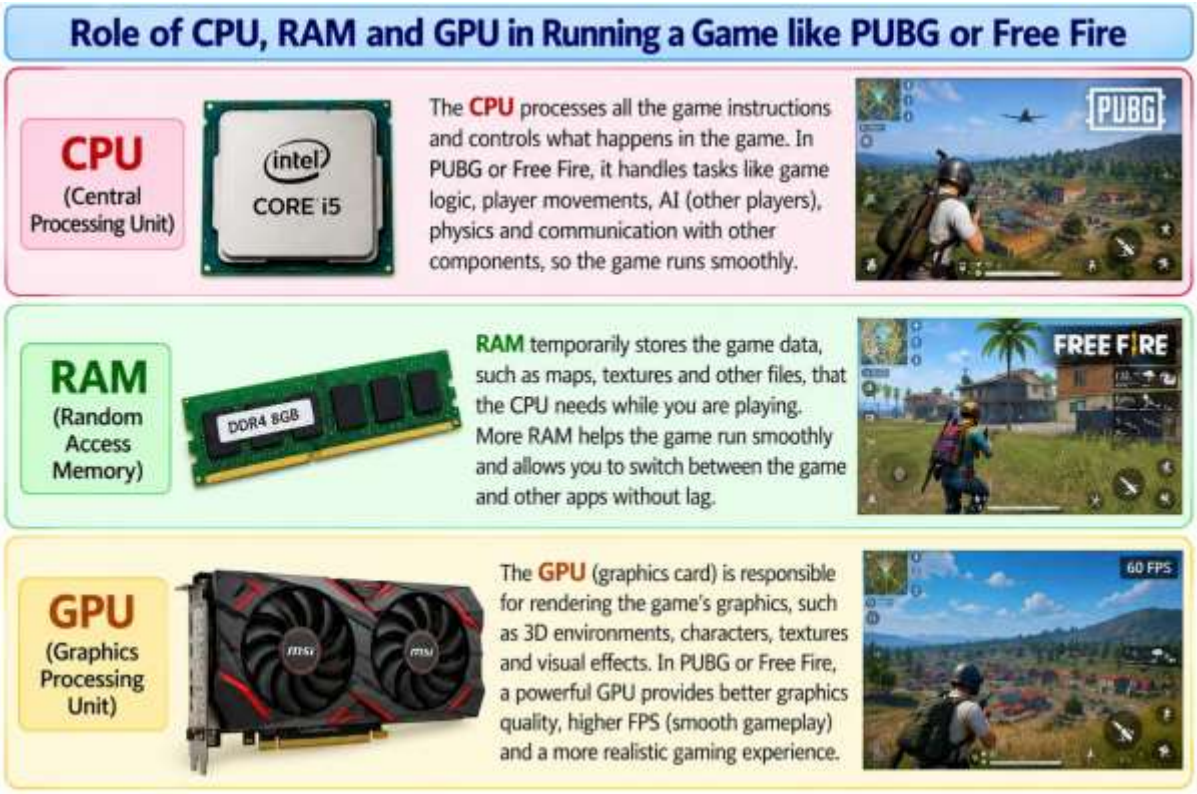

Feature	HDD (Hard Disk Drive)	SSD (Solid State Drive)
Speed	Slower at reading and writing data.	Much faster at reading and writing data.
Durability	Less shock-resistant because it contains moving parts.	More shock-resistant because it has no moving parts.
Technology	Uses spinning magnetic disks to store data.	Uses flash memory to store data.
Noise	Can produce noise while operating.	Operates silently.
Cost	Usually cheaper per GB.	Usually more expensive per GB.
Typical use cases	Desktop PCs, laptops, backups, and storing large files.	Laptops, gaming PCs, operating systems, and applications.
Loading time	Usually takes longer to start the computer and load games.	Usually starts the computer and loads games faster.

3. Write a short explanation (2-3 sentences each) describing the role of the CPU, RAM, and GPU in running a game like PUBG or Free Fire on a PC.

1. CPU (Central Processing Unit): The CPU is the brain of the computer. It controls the game and processes the game instructions.

2. RAM (Random Access Memory): RAM stores game data temporarily while we play. More RAM helps the game run smoothly and reduces lag.

3. GPU (Graphics Processing Unit): The GPU shows the game’s graphics, characters, and backgrounds on the screen. A good GPU helps the game look better and run smoothly.

4.Imagine you want to upgrade your PC to run the latest version of FIFA smoothly. List which hardware components you would consider upgrading and explain why for each.

1. GPU (Graphics Card): I would upgrade the graphics card to get better graphics.

2. CPU (Processor): I would upgrade the processor to make the game run faster.

3. RAM: I would increase the RAM to 16 GB to help the game run smoothly.

4. SSD: I would install an SSD to load the game faster.

5. Power Supply: I would upgrade the power supply if the new graphics card needs more power.

PC Upgrades to Run FIFA Smoothly

1. GPU (Graphics Card)

Upgrade the graphics card to get better graphics and smooth gameplay in FIFA.

2. CPU (Processor)

Upgrade the processor to make the game run faster and reduce lag.

3. RAM (Memory)

Increase the RAM to at least 16 GB so the game can run smoothly.

4. SSD (Solid State Drive)

Install an SSD to make the computer start faster and reduce game loading time.

5. Power Supply (PSU)

Upgrade the power supply if the new graphics card needs more power.

Smooth FIFA Gaming Experience
